## DETAILED ACTION

### *Response to Arguments*

1. Applicant's arguments have been considered but are moot in view of the new ground(s) of rejection.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-4, 6-18, 20-34, 36, 43, 73-87 are rejected under 35 U.S.C. 103(a) as being unpatentable over Vigil et al. (5,336,234) in view of Chen et al. (6,905,743). Vigil et al. disclose an angioplasty dilate balloon carrying cutting elements (19). Vigil et al. also teach that the stiffness of thin outer wall of a dilate balloon is a concern as placing the strips for support the cutting elements and Vigil et al. disclose using a reinforcing strips of metal or stiff plastic attached to the surface of the balloon. Although, Vigil et al. do not disclose a balloon with reinforced wall as claimed for supporting the cutting element, attention is directed to Chen et al. reference which discloses a balloon comprising a polymer matrix material and a plurality of fibers distributed in the matrix material to provide reinforcement thereof wherein the reinforcing fibers or rods being made from materials including fluoropolymer which is considered as a colorant material. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Vigil et al.'s balloon in view of Chen et al. by having

the reinforcing strips disposed within the wall of the balloon in order to reinforce the balloon as well as to enhance the radial expansion of a balloon to a predetermined extend, but which has minimal longitudinal growing during balloon inflation such that operation can be more precise. Doing so would meet the limitations of the claims.

Regarding the cutting element is carried by the balloon centered over the striped portion, it would have been obvious to one having ordinary skill in the art to place the cutting elements of Vigil et al in line or center over the reinforcing members/rod of the balloon of Vigil et al. in view of Chen et al. so that the portion of the balloon with reinforcing rod/filament would provide better support for the cutting element.
